CV-M10 BX/RS
Progressive Scan Monochrome Camera

- CCIR and EIA versions. EIA versions meet VGA format

- 1/2" Hyper HAD CCD with square pixels

- High resolution – horizontal 600 TV lines, vertical 575 TV lines

- Full frame read-out from a single frame shutter pulse

- Single channel progressive full frame in 1/25 sec. or 1/30 sec.

- 2-channel interlaced or 2-channel non-interlaced in 1/50 sec. or 1/60 sec.

- Fast asynchronous reset – frame or field shutter

- Shutter 1/60 to 1/10,000 or 1/20,000 to 1/800,000 sec.

- Long-time integration 2 to 16 fields

- Internal, external, HD, VD or random synchronization

- Set-up by RS 232C (RS version) or switches (BX version)

- RS 232C interface

- Windows 95/NT set-up software

- Software includes DLL and LIB files for easy integration

The leading manufacturer in high performance camera solutions

CV-M10 BX/RS CAMERA SERIES

Progressive scan CCD sensor

In the progressive scan CCD sensor the number of vertical transfer cells are equal to the total number of sensing photo diodes. The integrated charge in the diodes for both odd and even fields is at time XSG transferred as a full frame to the vertical register. From here the frame is read out with the double vertical speed to two horizontal registers. A full frame as a result of the same shutter pulse can be read out as two fields, each through its own output. By combining the two fields from output 1 and 2 in a frame grabber 50 or 60 frames are achieved. In non-interlaced scan mode, output 1 will be a progressive full frame (Line 1 - 2 - 3 - 4 etc.). It will take 1/25 or 1/30 second.
Asynchronous triggered shutter

The shutter function in the CCD sensor is done by draining all photo diodes in parallel with the XSUB pulse synchronized to HD. A last XSUB is generated from the negative external trigger pulse. This pulse will reset and synchronize HD in the camera. The selected exposure time will then start, and an image will be charged in the photo diodes. The selected shutter time will stop with a XSG and video enable pulse out 1 HD long (WEN). The WEN pulse indicates the beginning of the video read-out. The composite video signal is without V-sync. The WEN pulse indicates the start and top of the image. The video frame or field has to be read out prior to supplying a new trigger pulse.

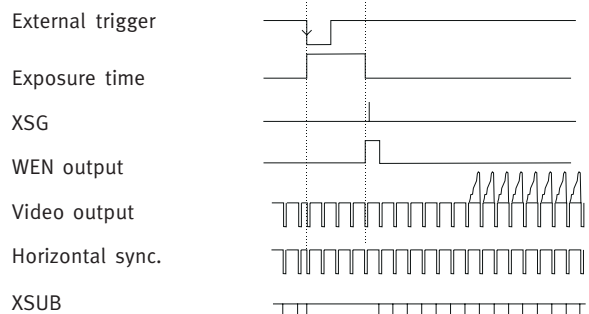

Frame grabber interface – single channel mode

This application shows a typical set-up for capturing a fast moving object and transfer it to a frame grabber as a full progressive scanned frame. It will take 1/25 or 1/30 second. The frame grabber needs an input for the WEN pulse for vertical sync.
The horizontal sync. is taken from the HD out or separated from the composite video signal from the camera.
A trigger sensor will detect the arrival of an object in the field of view and start the selected shutter time. By using the pixel clock (user option) to synchronize the frame grabber total jitter-free operation is achieved.

Set-up
Asynchronous trigger shutter.
Non-interlaced scan.
Video 1 output.

Result
1 full progressive scanned frame in frame grabber in 1/25 sec. or 1/30 sec.

Frame grabber interface – dual channel mode

This set-up shows an application where a progressive scanned frame consisting of 2 interlaced fields as a result of one shutter pulse is transferred to 2 field stores. The 2 fields need to be combined in the computer. This set-up makes use of the optional pixel clock output from the camera for a jitter-free image digitizing.
With this set-up a full progressive scanned frame is transferred to the computer in 1/50 second.

Set-up
Asynchronous trigger shutter.
If necessary through the frame grabber.
Interlaced scan.
Video 1 and video 2 output.

Result
2 interlaced fields in 2 field grabbers in 1/50 second. The pixel clock provides jitter-free image aquisition. For applications with sub-pixel accuracy.
The unique Windows NT based camera control tool makes it easy to control the M10 RS camera from a standard PC. The program includes an on-screen help function. Supplied DLL and LIB files with documentation allow easy integration of the camera control in custom application.

System requirements:

- 486 processor
- 1 MB free disk space
- Windows 95/NT (incl. DLL)
- Windows 3.1 (excl. DLL)
- Up to 9 com ports available
- 9600 bps

Interface cable (PC to camera)

CV-M10 SX
## Progressive Scan Monochrome Camera

- *1/2" progressive scan monochrome CCIR (SVGA) and EIA (VGA) camera*

- *Successor of the popular CV-M10BX/RS series*

- *Improved sensitivity and smear performance*

- *782 (h) x 582 (v) square pixels for CCIR (SVGA) version*

- *659 (h) x 494 (v) square pixels for EIA (VGA) version*

- *Single channel video output*

- *Extremely short shutter speed, down to 1/917,000 sec. for CCIR (SVGA)*

- *Internal, external HD/VD or random trigger synchronization*

- *Edge pre-select (EPS) and pulse width control (PWC) trigger modes*

- *Frame-delay readout*

- *H reset and H non-reset trigger*

- *Long time integration modes*

- *WEN and pixel clock output for easy interfacing*

- *Setup by Windows NT/2000/XP setup software via RS 232C*

The leading manufacturer of high performance camera solutions

Specifications for CV-M10 SX

Specifications	CCIR	EIA
Scanning system	Progressive scan	
CCD sensor	Monochrome 1/2″ IT CCD	
Sensing area	6.61 (h) x 4.97 (v) mm	
Frame rate (progressive)	25 frames/sec. (625 lines/frame)	29.97 frames/sec. (525 lines/frame)
Line frequency	15.625 kHz	15.734 kHz
Pixel frequency	14.75 MHz	12.2727 MHz
Effective pixels	782 (h) x 582 (v)	659 (h) x 494 (v)
